

Fig 4 · Anisotropy changes the field, not the comparison

source: 04_sensitivity.csv · 20 log10 (aniso - iso) per cell · mesh = truncated · † fibre tensor applied (2 of 10 muscles) · unmarked rows are NOT APPLIED, not measured-as-zero

THIS IS A NULL WITH A BOUND: per-cell changes reach ~5 dB, but every jaw-vs-ear GAP moves less than 0.09 dB, under the 0.27 dB floor. The contrast between those two magnitudes is the figure's point
