

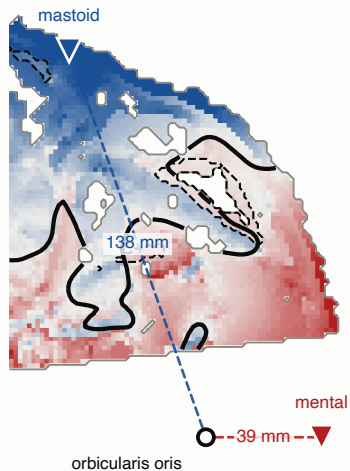

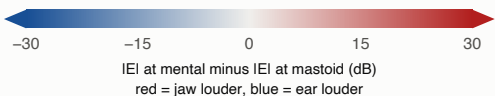

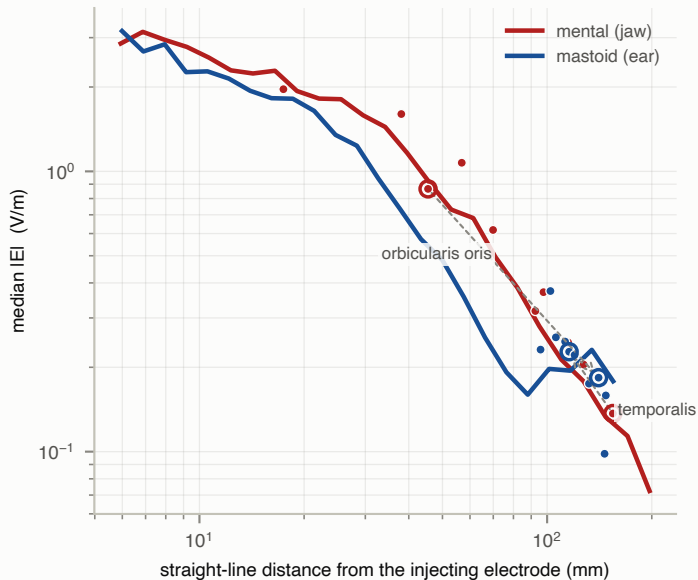

Fig 8 · The ear is not a worse electrode, it is a further one

A and B share one oblique line, the electrode and the muscle target, so the two distances are drawn to the same point, and the two starting points are cropped above S = 13.8 mm per licence 2.3.3

A · which electrode owns which tissue

B · one decay law, two starting distances

- A: crossover, where the two montages are equally loud
- A: muscle compartment crossed by the plane
- B: median in distance bins over all muscle tissue
- B: one whole compartment, at its own median distance
