

Fig 5 · Which montage sees which muscle, over all source orientations

thin rule = full min-max over 200 orientations · thick bar = interquartile · marker = median

FILLED marker = sign stable at every orientation (5 of 10 muscles) · open marker = verdict depends on fibre direction

VERDICTS ARE TWO-AXIS (Table 4): only temporalis is robust to BOTH orientation and site sampling; SCM and lateral pterygoid fail the matched-count test and are no resolvable preference

<-- ear wins

jaw wins -->
